

Day 20 - Go (Golang Basics) - Conditional Structures

If Statements [🔗](#)

An `if` statement is used to execute a block of code if a condition is true.

Syntax: [🔗](#)

```
if <condition> {  
    // executes when condition is true  
}
```

Example: [🔗](#)

```
1 package main  
2  
3 import "fmt"  
4  
5 func main() {  
6     var fruit string = "apple"  
7  
8     if fruit == "apple" {  
9         fmt.Println("Fruit is apple")  
10    }  
11  
12 }
```

If-Else Statement [🔗](#)

An `if-else` block provides two paths: one for true, one for false.

Syntax: [🔗](#)

```
if <condition> {  
    // executes when condition is true  
} else {  
    // executes when condition is false  
}
```

Example: [🔗](#)

```
1 package main  
2  
3 import "fmt"  
4  
5 func main() {  
6     var fruit string = "apple"  
7  
8     if fruit == "apple" {  
9         fmt.Println("Fruit is apple")  
10    } else {  
11        fmt.Println("Fruit is not apple")  
12    }  
13  
14 }
```

If-Else If-Else Statement [🔗](#)

Used to check multiple conditions.

Syntax: [🔗](#)

```
if <condition1> {  
    // executes if condition1 is true  
} else if <condition2> {  
    // executes if condition2 is true  
} else {  
    // executes if neither is true  
}
```

Example: [🔗](#)

```
1 package main  
2  
3 import "fmt"  
4  
5 func main() {  
6     var fruit string = "apple"  
7  
8     if fruit == "banana" {  
9         fmt.Println("Fruit is banana")  
10    } else if fruit == "apple" {  
11        fmt.Println("Fruit is apple")  
12    } else {  
13        fmt.Println("Fruit is neither banana nor apple")  
14    }  
15  
16 }
```

Switch Statement [🔗](#)

A switch statement allows you to perform different actions based on the value of a variable or expression.

Syntax: [🔗](#)

```
switch variable {  
case value1:  
    // code block  
case value2:  
    // code block  
default:  
    // default block  
}
```

Example: [🔗](#)

```
1 package main  
2  
3 import "fmt"  
4  
5 func main() {  
6     fruit := "apple"  
7 }
```

```

8  switch fruit {
9  case "banana":
10     fmt.Println("Fruit is banana")
11 case "apple":
12     fmt.Println("Fruit is apple")
13 default:
14     fmt.Println("Unknown fruit")
15 }
16
17 }

```

Fallthrough [↗](#)

The `fallthrough` keyword is used to continue executing the next case even if it doesn't match.

Example: [↗](#)

```

1  package main
2
3  import "fmt"
4
5  func main() {
6     number := 2
7
8     switch number {
9     case 1:
10        fmt.Println("One")
11     case 2:
12        fmt.Println("Two")
13        fallthrough
14     case 3:
15        fmt.Println("Three")
16     default:
17        fmt.Println("Unknown")
18     }
19
20 }

```

Switch With Conditions [↗](#)

You can use conditions in switch statements without providing a variable.

Example: [↗](#)

```

1  package main
2
3  import "fmt"
4
5  func main() {
6     age := 18
7
8     switch {
9     case age < 13:
10        fmt.Println("Child")
11     case age >= 13 && age < 20:
12        fmt.Println("Teenager")
13     case age >= 20:
14        fmt.Println("Adult")

```

```
15 }  
16  
17 }
```
